Operations note: reproducible snapshots

Before an evaluation, freeze the corpus manifest.

The manifest records relative source names and content SHA-256 hashes.

Keep query rewriting disabled for baseline comparisons.

Record embedding identity, vector dimension and chunk settings.

Operations note: recovery checklist

If an embedding provider fails during ingestion, retain the old index.

A successful retry replaces the document and all vectors atomically.

After deletion, verify that no orphan chunks remain searchable.

Back up SQLite through its online backup API when the service is live.
